Create App

Add to CoreDB → Add to UserDB → Clone from Temp
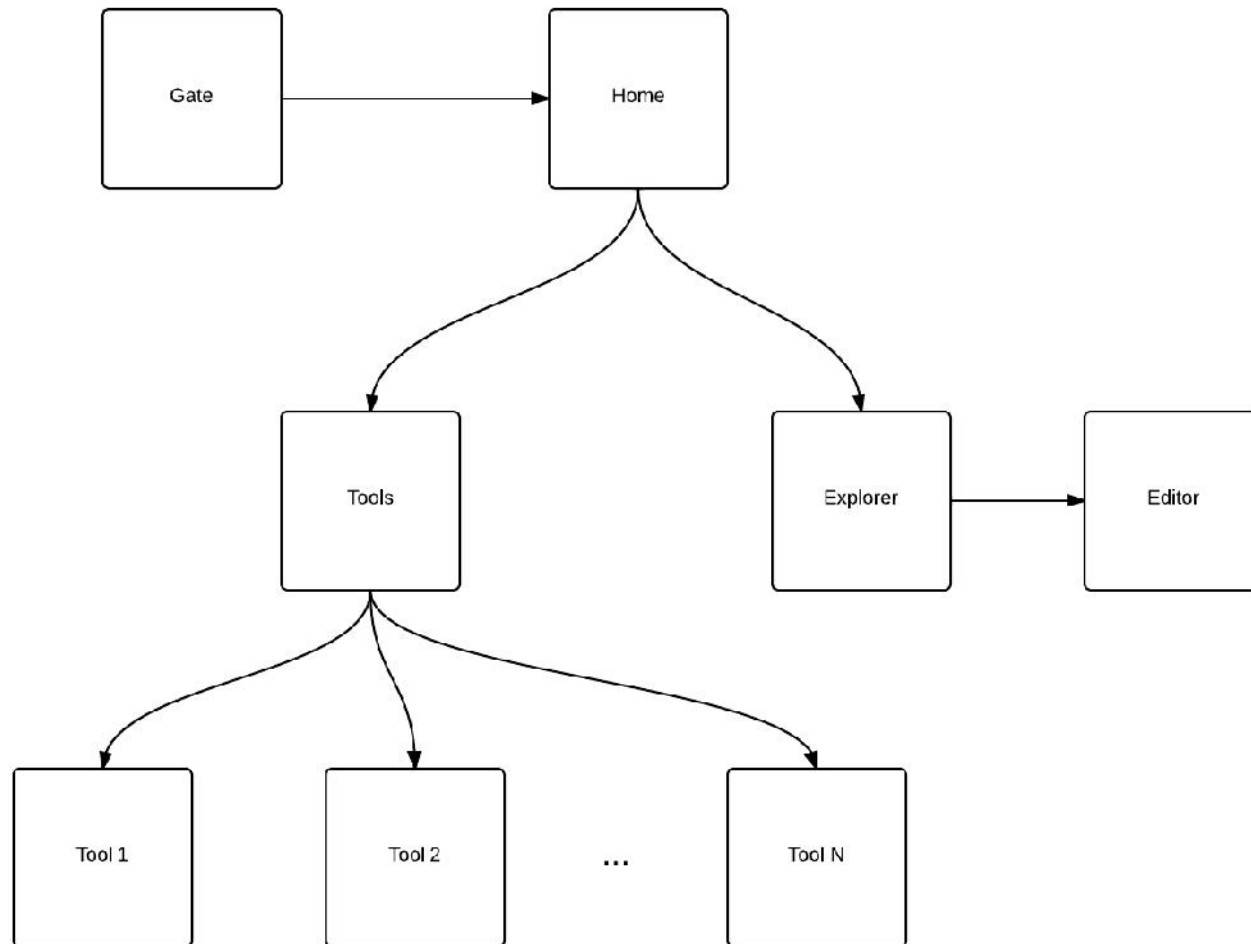

Cloning

```python
def clone(source, dest):
    from os import listdir
    from os.path import isfile

    for item in listdir(source):
        if isfile(source + item):
            source_file = open(source + item , 'r')
            dest_file = open(dest + item , 'w')

            dest_file.write(source_file.read())

        else:
            from os import mkdir

            mkdir(dest + item)
            clone(source + item + '/', dest + item + '/')
```
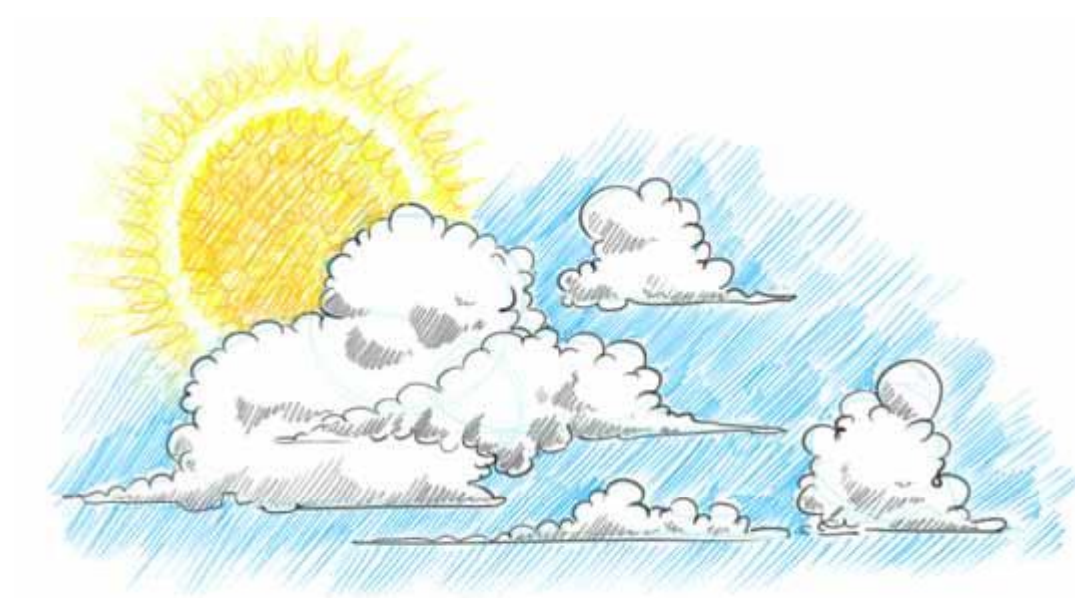

Compiler

Program → Subprocess → Python Compiler → App Source Files
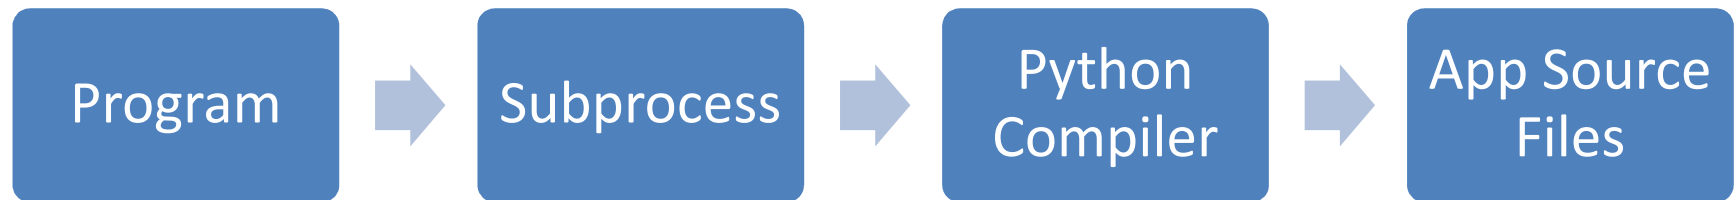

Calling Python

```python
from subprocess import Popen, PIPE

p = Popen(
    [
        'python',
        source_file
    ],
    stdout = PIPE,
    stderr = PIPE
)
output, err = p.communicate()

if err:
    return '<pre>' + err + '</pre>'
```
